Introduction

Teseo-LIV3F is a tiny GNSS modules sized 9.7 mm × 10.1 mm × 2.5 mm featuring STMicroelectronics® positioning receiver TeseoIII. It is a standalone positioning receiver which embeds the new ST GNSS positioning engine capable of receiving signals from multiple satellite navigation systems, including GPS, Glonass or Beidou, Galileo and QZSS.

It embeds 16M-Bit serial Flash.

In *Figure 1* pinout of the module.

List of tables

List of figures

1 Power

Teseo-LIV3F is supplied by 3 power pins: VCC (pin8), VCC_IO (pin7) and VBAT (pin6)

1.1 VCC (pin8)

VCC is the main supply. V_{CC} limiting values are: 2.1 V - 4.3 V.

A startup or during low power application current can change suddenly. It is important that supply IC is able to provide this current variation.

1.2 VBAT (pin6)

VBAT is the supply for the low power domain backup: backup RAM and RTC.

VBAT can be either connected to VCC or it can be supply by a dedicated supply always ON. When VBAT supply is kept ON during low power mode to allow fast recovery of GNSS fix

VBAT is preventing current flow as soon as VBAT is lower than VCC. It is important when VBAT is supplied with small battery and especially if battery is not rechargeable.

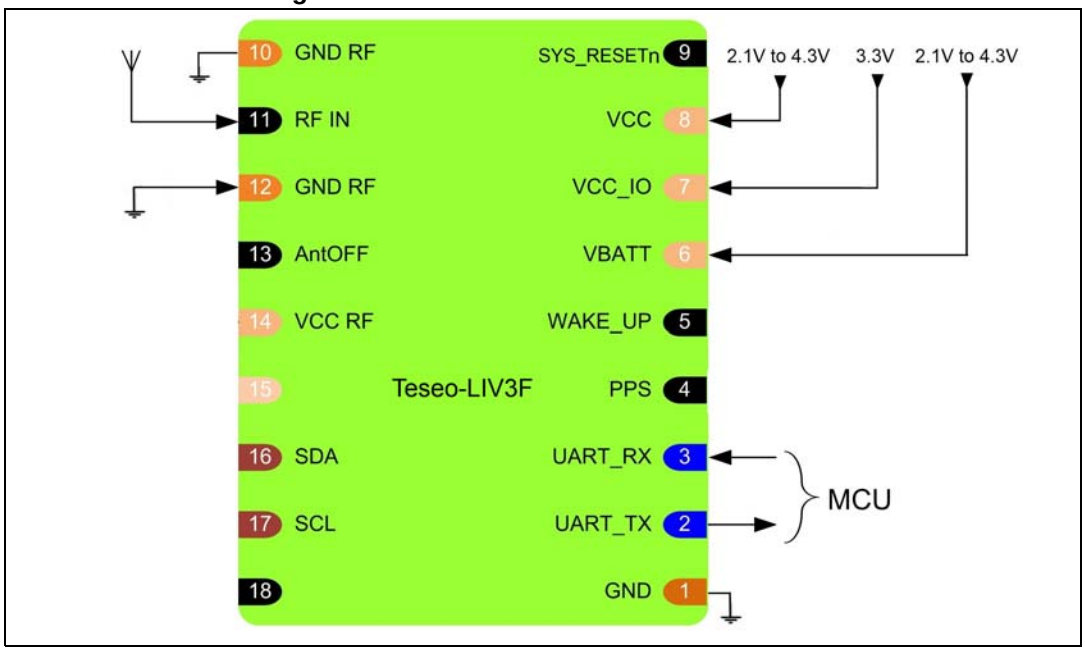
VBAT range can be from 2.1 V to 4.3 V.

1.3 VCC_IO (pin7)

VCC_IO is 3.3 V.

Figure 2 shows the minimum connection to make Teseo-LIV3F GNSS working.

Figure 2. Teseo-LIV3F minimum connection



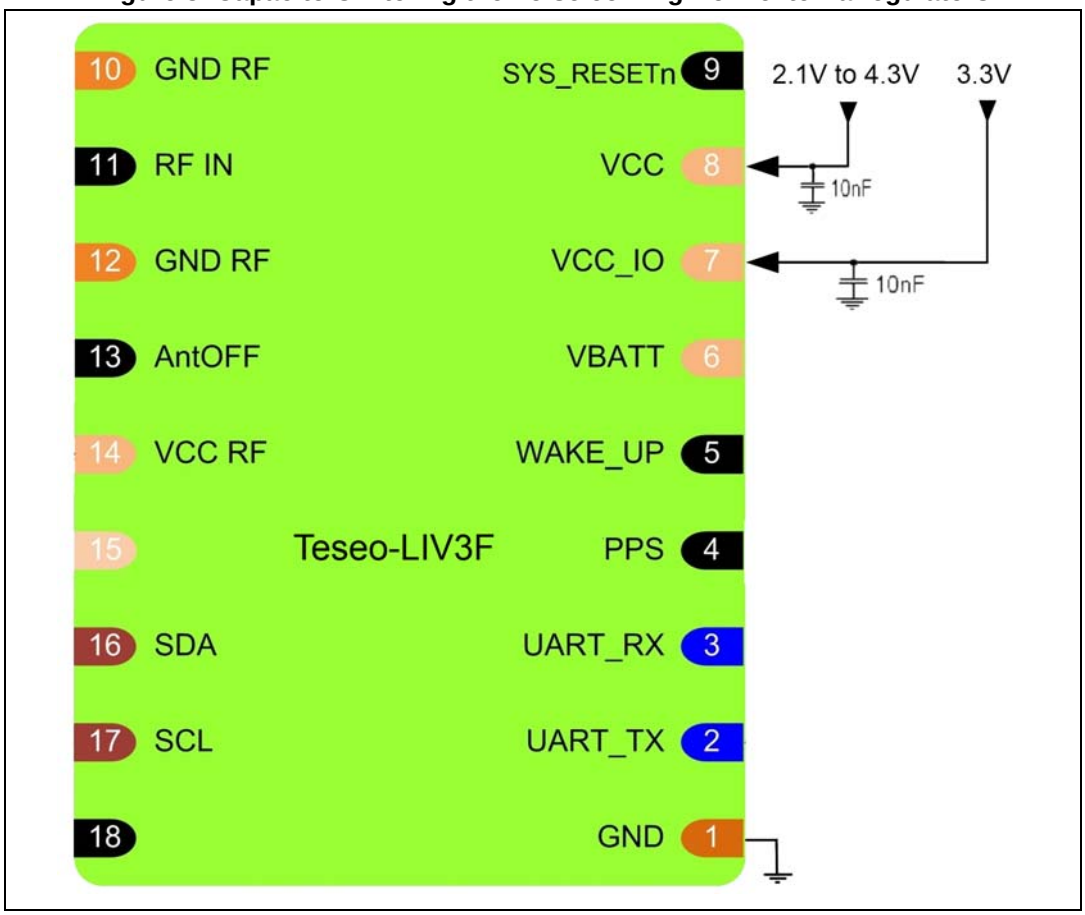
1.4 VCC_RF (pin14)

VCC_RF is an output image of VCC with a filtering for LNA or active antenna supply.

1.5 Power supply design reference

To reduce and filter the noise coming from the external regulator it's suggested a 10nF capacitor on VCC and VCC_IO as shown in following picture.

Figure 3. Capacitors filtering the noise coming from externa regulators



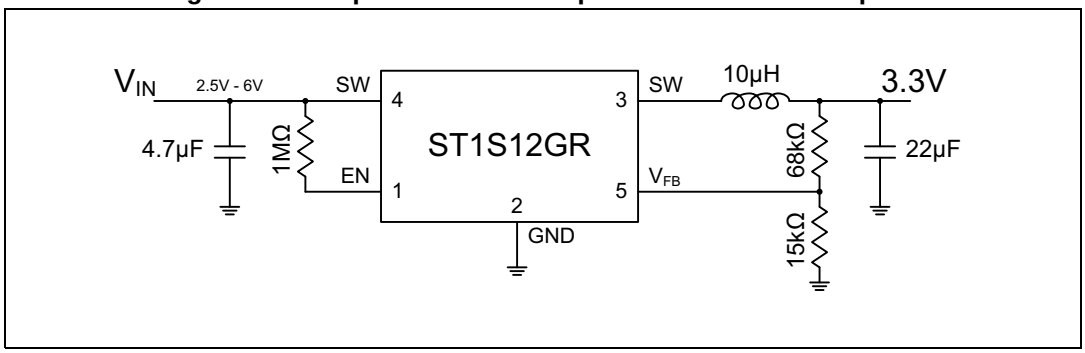
If VCC and VCC_IO are same supplies, one capacitor only can be used.

1.6 Current consumption optimization

Use of an SMPS at 2.1V to supply VCC is recommended to optimize current consumption.

Here is an application example with ST1S12GR with an efficiency around 85%.

Figure 4. Example of SMPS to improve current consumption



If VCC_IO is also supplied by an SMPS, this will reach the lowest current consumption.

2 Reserved (pin2, 15)

In Teseo-LIV3F pin2 and pin15 are reserved.

3 Interfaces

3.1 I2C (pin16, 17)

Teseo-LIV3F supports I2C slave mode only.

Internal pull-up resistor on VCC_IO are present. It is important to avoid to have other pull-up for current leakage in low power mode.

3.2 UART (pin2, 3)

UART is Universal Asynchronous Receiver/Transmitter that support much of the functionality of the industry-standard 16C650 UART.

These UARTs vary from industry-standard 16C650 on some minor points which are:

- Receive FIFO trigger levels
- The internal register map address space, and the bit function of each register differ
- The deltas of the modem status signals are not available
- 1.5 stop bits is not supported
- Independent receive clock feature is not supported

4 I/O pins

4.1 PPS (pin4)

PPS is the time pulse every one second. It can be configured with different condition of pulses.

4.2 Wake_Up (pin5)

It is an external interrupt that is used to wake-up Teseo-LIV3F for asynchronous wake-up during standby software for instance.

It can be activated by a GPIO from host for instance. Wake_Up signal is active high.

4.3 SYS_RESETn (pin9)

It can force a Tese-LIV3F under reset.

Reset signal is active low.

Host processor must have full control of this pin to guarantee the Teseo-LIV3F's firmware upgrade support.

4.4 RF_IN (pin10)

It is the RF input.

4.5 AntOFF (pin13)

AntOFF is a GPIO used to switch OFF external LNA or switch OFF current for the active antenna.

A 10kΩ pull down is necessary to ensure a low level during standby period.

5 Standby modes

Standby mode, is the mode where only low power backup domain is running. It means VBAT must be always maintain. It allows to have very low current consumption and fast GNSS reacquisition at the end of the standby time due to RTC.

Teseo-LIV3F offers 2 different ways of standby:

- Hardware standby
- Software standby

As IO buffers are not supplied during standby mode, it is important to keep all IO without external voltage to avoid any current leakage. UART_RX is an exception it can be left high.

5.1 Software standby

Software standby is activated by the binary for periodic standby. More details how to set it are in Software Manual. As HW standby, all supplies are kept ON.

Periodic fixes are from 5s up to 24hours between 2 fixes.

It ensures a current below 20µA on Teseo-LIV3F. Be careful that VCC_RF is ON during this standby, then in case of active antenna or external LNA, it is important to switch them OFF.

5.2 Hardware standby

This standby is ensured by switching OFF VCC (pin 6) and VCC_IO (pin 7) supplies and setting SYS_RESETn (pin 9) to 0 V. It can be activated asynchronously from GNSS binary with one GPIO switching OFF the supplies from a host.

During this standby only VBAT (pin 6) is kept ON.

It ensures a current below 15µA. During this standby mode VCC_RF (pin 14) is OFF.

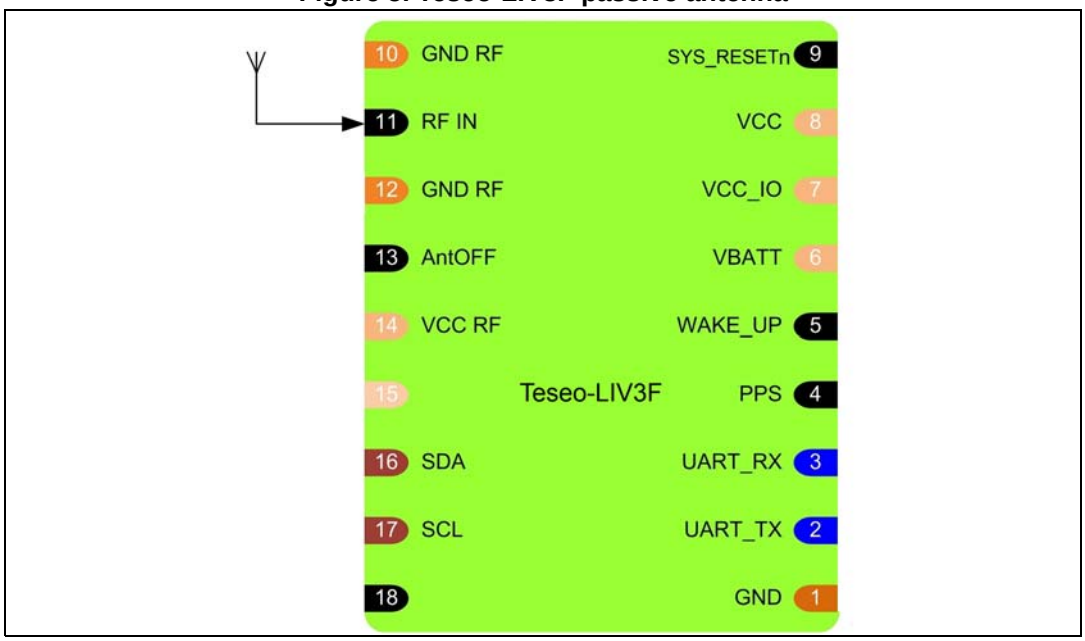
6 Front ends management

RF input impedance is 50 Ω.

6.1 Passive antenna

A passive antenna can be directly connected to Teseo-LIV3F. Take care that the antenna has to be close to the module. In addition, it could be possible that matching component must be necessary to match the antenna.

Figure 5. Teseo-LIV3F passive antenna

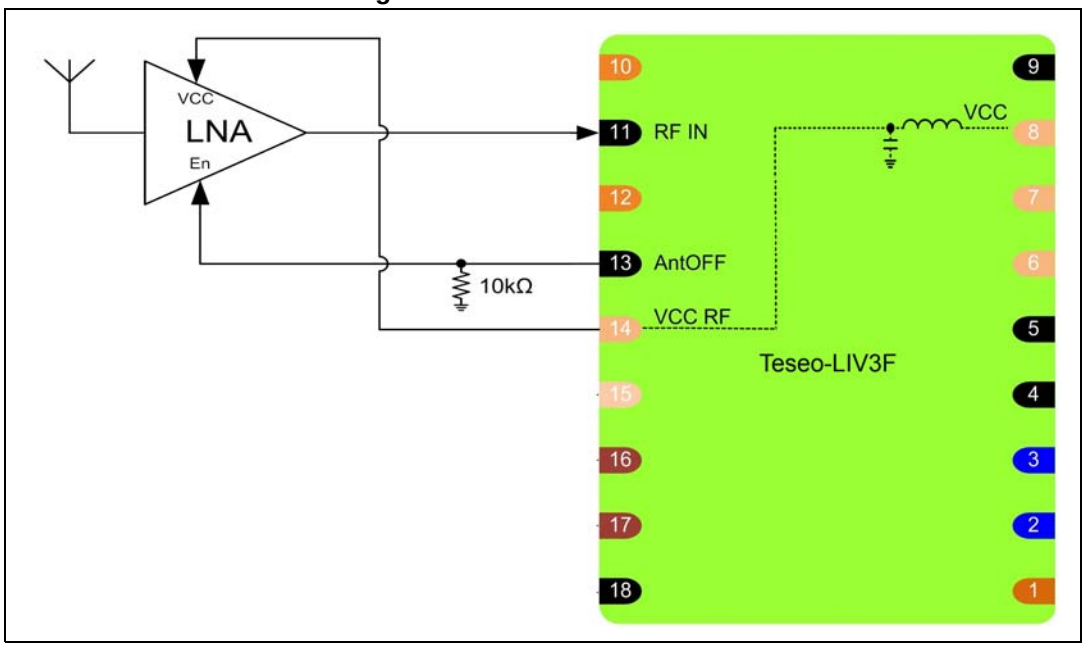


6.2 External LNA

External LNA means a passive antenna used with an LNA on the same PCB than Teseo-LIV3F module. To optimize power consumption during low power mode if needed, the LNA should have an enable pin compatible with VCC_IO to be switched OFF/ON.

Here is a block diagram describing the connection:

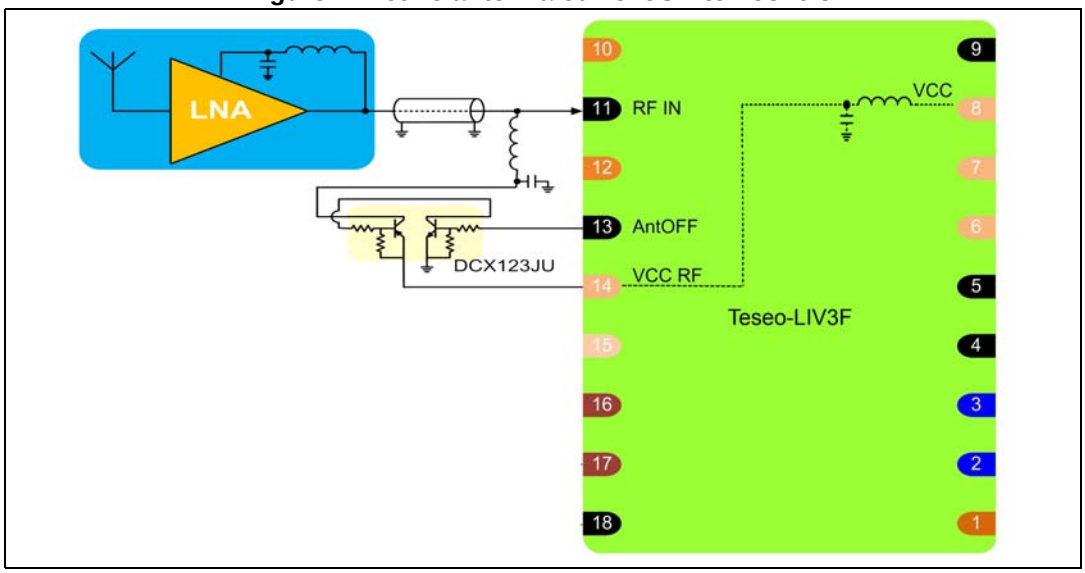
Figure 6. External LNA control



6.3 Active antenna

To optimize the current during low power operating mode, the active antenna can be used with a switch to cut the current flow.

Figure 7. Active antenna current switch control



To improve the functionality, a current limiter could be used in order to prevent any short circuit on the antenna see *Figure 8*.
